**Keynote Title:** “The New Realities of Big Data, Artificial Intelligence, and FinTech: Future Prospects and Implications”

**Abstract:** Even though we may argue that big data, Financial Technologies (FinTech), and Artificial Intelligence (AI) are new phenomena, they existed before we coined the modern terms. Big Data accumulated before we even realized it Big Data existed. AI helped us analyze the growing data before we thought it was AI

and FinTech was there to make the large amounts of financial data more meaningful.

As big data accumulated over time, analyzing it for decision-making became increasingly difficult for human minds to tackle. So, AI was needed to do the job, and FinTech plays a role in the specific realm of the financial world. All that information had to be analyzed by humans for decision-making purposes. This used to be a tedious, time-consuming task and even resulted in inefficient decisions. All of these tasks are now done by AI systems. The human involvement in these decisions is shrinking day by day. For example, we had to do numerous hours of calculations to analyze stock data for placing a single order. This process has been automated so much that the AI analyzes the data for us and trades on our behalf and has proved to be making more money than an average investor. In the marketing and customers relations space, AI is the driver in making critical decisions. Customers’ social activity, product reviews, likes/dislikes, shared content, and even their searches for specific products are analyzed by the artificially intelligent machines, loyalty/rewards applications, and CRM (customer relationship management) systems. Finance is being transformed by AI, big data and blockchain technologies. The emerging technologies of decentralized finance (DeFi) and Non-Fungible Tokens (NFTs) will transform the world in the years to come. All businesses and in particular, financial institutions must embrace these new technologies before its too late.

This keynote speech sheds light on the future prospects and challenges for businesses in the emergence of these new technologies.

**Keynote Title: “Industry 4.0, Environment and Human Rights”**

**Abstract:** Technological advancement, especially in digital technologies, has had such an advance at the business level that it has produced yet another Industrial Revolution with all the consequences for business development in constant change.

Alongside this Industrial Revolution caused by computer/digital technological development, there is another in terms of energy producing sources, that is, we are witnessing the replacement of polluting energy producing sources, based on fossil fuels, by the so-called clean energy, or that is, based on natural sources, wind, sun, water and biomass.

These simultaneous changes that currently involve the industry have, of course, implications for Human Rights.

In this study, we intend, then, to link the consequences for the industry of the new revolutions produced by the advancement of digital technologies, with the introduction of new sources of clean energy and the link with Human Rights.
